

Cylinders

In addition to fabricating steel tank heads, Brighton Tru-Edge is capable of rolling cylinders dimensionally matched with the heads. Purchasing both tank heads and cylinders from Brighton is beneficial to our customers in a number of ways:

- **Savings in fit-up costs:** Heads and shells can be made to match and machined with our Tru-Edge bevel, which is an important key to speeding tank assembly and welding.
- **Control over scheduling:** By purchasing heads and shells from a single source, less expediting is needed and better control over scheduling is maintained.
- **Savings in transportation costs:** Shipping the heads and shell together will save on the cost of freight, and they will arrive to a job site together at the same time.

In stainless steel, carbon steel, nickel alloys, clad, aluminum and other exotic materials, Brighton has the capability of rolling plates up to 16 feet wide. We can fabricate shells from 14" OD to approximately 30' in diameter, offering them as fully welded and x-rayed with a partial data report, rolled and tack welded, or rolled and strapped. Brighton is also capable of pickling cylinders in stainless and nickel alloys, as well as polishing on both the OD and ID.
